

ACCESSORIES for models DVH-050 and DVW-050

The model DVW-050 Disperser/Mixer could be fitted with a turbine, in this view is showed axial flow turbine, 10" diameter with holding plate bolted to bottom of mixing shaft. In this configuration, the Disperser/Mixer could be used (in selected cases) as a mixer for blending and agitating due to the low speed of about 500 rpm. Other drives could be designed for a lower speed to 180 rpm by limiting the top speed.

The view at left shows the can lock for use with standard 55 gallon drum. This can lock assembly could also be used with smaller or larger mixing containers.

The view at left shows the relative position of the high speed blade in the standard 55 gallon drum. This blade could be substituted with a turbine in certain cases.
